

Inspection of floor-mounted pull-out unit

Yearly, preferably together with rack inspection

- Check so the unit rolls easy with no noise
- Lift the unit in the front side for better access to ball bearings, wheels and floor rails
- Clean area under unit, if needed
- Check so floor rails and floor stops are intact and tightened to the floor
- Check front wheels and rear ball bearings for cracks or other damages, clean if needed
- Put unit back on the floor
- Check side handle for damages
- Check so the unit locks in inner position
- Antiskid tape and/or pallet stops – inspect for damage (Optional)
- Load capacity label – check so label is easy to read
- Replace unit that shows sign of improper use, for example if main structure is bent or damaged

Daily, as a part of normal work procedures

- Locking handle – report any damage causing locking handle not to work properly
- Extraction - report any damage causing unit to run rough or with higher force than normal
- Damages - report if unit has been hit hard fork lift, so it can be inspected for damages

Failure to report and repair damages can result in injury or death. Never use damaged pull-out units. Contact a service technician to inspect and repair damages!
