1 General information

External gear motors are widely used in modern hydraulic systems due to their high performance, long service life and low maintenance costs.

With the new APM212 family, high operating pressures, excellent volumetric and mechanical efficiencies were achieved; moreover, for LN-series (Low Noise versions), definitely better acoustic performances were obtained.

Different features of the new APM design were deeply analyzed and studied in order to get to the above mentioned results; primarily, engineering attention was focused on the design of the gear teeth and balancing areas but also

materials, heat treatments and coupling tolerances were carefully considered during the development process; these project variables linked to a continuous tight test schedule (even performed in our semi-anechoic room) were the tools adopted by Bucher to achieve the excellent performance of these gear motors.

Bucher Hydraulics philosophy is based on continuous improving; this concept is enforced by high-end control and manufacturing techniques in Production and by a Quality Control System which guarantees that every single product can offer the same high standard level.

1.1 External gear motors for general use

New APM212 motors benefits

- High hydraulic and mechanical efficiencies
- Able to withstand high pressure
- Long life due to optimised materials used
- Low Noise and vibration features available also in "standard" version
- Low Noise motors with new gears profile available
- outrigger bearing available

Examples of typical applications

1.2 Fan Drive Gear Motors for cooling systems

In the Fan Drive Gear Motors for cooling systems we implemented the shaft seal protection adding a dedicated sealing. Consequently, dedicated cast iron front covers have been designed. See section 3.4.2

New APM212 motors benefits

- Improve machine operating efficiency
- Reduce the costs of maintenance
- Reduce noise and vibrations
- Allow to integrate hydraulic values circuit
- Electronic control available

Examples of typical applications

Hydraulic scheme examples

1.3 External gear motors components

1. Retaining ring
2. Shaft seal ring support
3. Shaft seal
4. Front cover
5. Back up seal
6. Balancing seal
7. Balancing block

8. Take off power gear
9. Gear
10. Oil seal
11. Centering pin
12. Motor body
13. Back cover
14. Fixing screw and washer

1.3.1 Improvements (New APM212 vs APM200)

Front covers :

In addition to aluminium versions, complete new range of cast iron front covers

Balancing blocks :

New generation optimised and standardised balancing blocks

Gears :

New gears profile (12 teeth) and increased transmissible torque

Bodies:

New design pump bodies

Back covers :

Wide range of aluminium and cast iron back covers with/without integrated cartridge valves

Seals :

As general rule, shaft seal (Pos.3), balancing seals (Pos.6) and body oil seals (Pos.10) are in HNBR material.

1.4 Example of typical sound pressure level recorded in a semi-anechoic testing room

Oil temperature: 40°C - Oil viscosity: 32 mm²/s
Distance between motor and sensor: 1 m

1.5 Technical data

Features		
Operating fluid temperature range (mineral oil):	NBR HNBR	-15 / +80 °C (peak: -20 / +90 °C) -20 / +90 °C (peak: -30 / +110 °C)
Recommended fluids		hydraulic mineral oil-based
Viscosity range:	Recommended Permitted Permitted for starting	20-120 mm ² /s (cSt) 12-700 mm ² /s (cSt) 2000 mm ² /s (cSt)
Cleanliness:	recommended up to 140 bar (2000 PSI) recommended up to 210 bar (3000 PSI) recommended up to 275 bar (4000 PSI)	20/18/15 ISO 4406 19/17/14 ISO 4406 17/15/12 ISO 4406
Minimum storage temperature:	NBR HNBR	-25 °C -35 °C
Standard seals material (valves not included)		NBR + HNBR standard (ISO1629)

* Referred to motors with flanged ports. Utilising threaded ports, please to consider a significantly de-rated performances.
The mechanical stress localised on threaded ports cause a reduced motor life performances

** Obtained with a specific balancing plate

IMPORTANT!: Please consult Bucher Hydraulics if even one of the operating limits indicated in the table (temperature, pressure, rpm) is exceeded, as well as in the case of two or more maximum values at the same time, or for applications with particularly heavy-duty cycles

1.6 High inlet pressure

Pressure levels:

P1 = continuous pressure

P3 = max peak pressure

Application of motor operating at a high number of load cycles has to be submitted to our approval.

1.7 Identifying the rotation direction

The rotation direction of a gear motor is identified by looking at the motor from the front and with the drive gear turned upwards (see figures below).

Motors with clockwise rotation (D) have a drive gear which turns clockwise, with the inlet port on the left and the outlet port on the right.

Motors with counterclockwise rotation (S) have a drive gear which turns counterclockwise, with the inlet port on the right and the outlet port on the left.

The figure also shows the pressure flow inside the motors as the oil is transferred from the inlet port to the outlet port.

As regards reversible motors (R), the ports are alternatively for inlet and outlet.

Motors with a unidirectional rotation (D or S) have the denomination APM. Motors with reversible rotation have the denomination APMR.

Motors with "Low Noise" components have the denomination LN.

1.8 Outlet

1.8.1 Unidirectional motors

As a matter of principle, unidirectional motors correspond to counter rotating pumps.

The balancing seals are not symmetric and, consequently, two different pressure sides: inlet High-pressure and outlet Low-pressure side, which must not be exchanged each other, are defined.

The outlet Low-pressure side loads the back side of the oil retaining shaft seal, a dedicated steel ring for supporting it, is adopted.

The maximum outlet Low-pressure value is limited by the shaft seal and its support, see limit indications, page 10/56

To keep P_{OUT} below the suggested value, the following must be avoided:

- long distance between motor and tank
- long stretches of piping
- special features such as: bends; reductions in diameter;

quick couplings; etc.

Having filtration on the return it is also advisable to choose a filter of a suitable size to minimise any pressure drop and to take measures to prevent gradual clogging over time.

1.8.2 Reversible motors

Reversible rotating motors have symmetric balancing seals and both port, inlet and outlet, can be, alternatively, operate as inlet High-pressure and outlet Low-pressure port.

A sealed area is connected to the back side of the oil retaining shaft seal and its pressure must be limited connecting it to the tank, through a drain threaded port, which is generally, placed on the motor rear cover.

The drain hose must be chosen in order to avoid that the pressure at the drain port does not exceed the maximum admitted pressure, see limit indications, page 10/56.

1.9 Radial and axial load

1.9.1 Standard version

Bucher APM212 gear motors are suitable to work also when radial and axial loads are applied to it.

In order to guarantee the correct life of the hydraulic motor, it is necessary to let the component work within the limits indicated in the table below:

Radial load	100 N
Axial load	500 N

1.9.2 Bearing front cover support

High values of radial and axial loads can cause the wear of the motor internal components; as a consequence, motor performance and life can be dramatically reduced.

Bucher Hydraulics studied special front covers having a bearing on-board which allow the motor to tolerate loads higher than the previous ones shown in 1.9.1

When the hydraulic motor is assembled in an application using a coupling, the joint must be able to absorb any discrepancies in the coaxial alignment of the gear motor-driven shaft without applying any loads on the motor shaft.

In the coupling between splined shafts, the connection sleeve must be free to move along its axis; the length of

What shown must be considered the worst load conditions which our motors have to submit to.

Radial load: the maximum admissible radial loads must be calculated considering both the fan weight and the unbalanced mass.

Axial load: the limits of axial loads apply to both directions (in inwards and in outwards).

When radial and/or axial loads exceed the above stated values, a front bearing support must be adopted.

this sleeve must be sufficient to fully cover the splined sections of the motor-driven shaft in any of its positions. A clearance between shaft ends is necessary.

It's important to check that the spline coupling is reasonably lubricated allowing its protection against a rapid deterioration.

Should any radial and/or axial loads be applied to the take-off-shaft (e.g. when it is coupled to a V-belt and pulley or to a pair of gear wheels), a front cover with supporting bearings.

Depending on the motor model, these supports can replace the front cover of the motor or can be fitted in addition to it (assembling it on the front cover itself).

1.10 Application check

In order to extend the life of the gear motor (which depends on motor speed, system pressure, and other system parameters), Bucher Hydraulics strongly recommends the following actions:

- **Perform a prototype testing programme** in order to check its functionality and its behaviour with the machine which will be equipped with this component.
- **Avoid cavitation;** every action which reduces the quantity of air trapped in the system is worth to extend all system components life.

- **A maintenance of the fluid and of the filtering system** has to be regularly accomplished. A clean fluid can extend the life of the system reducing its consequent failures.

Before to introduce the motor into the machine it is necessary to check if the application match the motor specifications. In particular:

1. Pressure limits

It is important to remain inside the catalogue limits as P1 (continuous) and P3 (peak) see section 1.5.

2. Return line and/or case drain line

The case drain line must be connected directly to tank if possible using a dedicated connection. The connection size should be dimensioned with appropriated internal passage

in order to maintain as low as possible the pressure inside. The max allowed pressure depending on the speed and the viscosity. See limits indications.

Limit indications:

Shaft seal: Maximum pressure admitted

IMPORTANT! The pressure on the outlet line has to be checked in order to choose the right motor configuration. Different solutions are available depending on pressure value recorded. See examples from 1 to 4

1 Unidirectional motor APM

2 Bidirectional motor used in only one direction

3 Unidirectional motor APM

4 Bidirectional motor APMR

1.11 General installation precaution

In addition to the recommendations regarding fluids, filtration, coupling, etc., we suggest the following:

- For unidirectional motors check always the rotation direction of the motor's take off shaft; it must be compatible with the rotation direction of the motor itself.
- Be particularly careful in cleaning and make sure, when connecting the high and low pressure piping, that no chips, rag threads, teflon tape, etc. get into the motor circulation system.
- Check the tightness of the high and low pressure fittings, the correct positioning of the O-Ring, and make sure there is no dirt between the flange and the motor body.
- To ensure the best heat distribution inside the tank,

make sure the return pipe is not too close to the pump's suction piping.

The pipes themselves should be below oil tank level to prevent the formation of foam.

- Do not subject the motors to operating conditions different from those indicated on section 1.5 ; for extreme operations, always contact our Technical Department.
- Never use fluids different from those indicated in section 1.5.
- Ambient temperature range: -20 / +50 °C
- In the event of motor painting, do not use solvents or paints that are incompatible with the material of the seals. Do not bake paint with excessively high temperatures.

Example of several hydraulic circuits available:

1.12 Directives and standards

- Atex:

Attention: The equipment and protective systems of this catalogue ARE NOT intended for use in potentially explosive atmospheres. Ref: Directive 99/92/EC and Directive 2014/34/EU

- ISO 9001:2015 / ISO 14001:2015

Bucher Hydraulics S.p.A. is certified for research, development and production of directional control valves, power units, gear pumps and motors, electro pumps, cartridge valves and integrated manifolds for hydraulic applications.

Square key

1.14 Gear motor formulas

The following parameters are defined:

V_c = (cm³/r) motor displacement;

n = (r/min) no. of rpm of the outlet shaft;

Q = (l/min) flow rate;

Δp = (bar) $P_{IN} - P_{OUT}$, operating Δp pressure;

T = (Nm) outlet torque;

N = (kW) outlet power;

η_v = (%) volumetric efficiency;

η_m = (%) mechanical efficiency;

η_t = (%) total efficiency ($\eta_t = \eta_v \cdot \eta_m$)

$$Q = \frac{V_c \cdot n}{10 \cdot \eta_v}$$

$$V_c = \frac{10 \cdot Q}{n} \cdot \eta_v$$

$$n = \frac{10 \cdot Q}{V_c} \cdot \eta_v$$

$$\Delta p = \frac{T}{1.592 \cdot V_c \cdot \eta_m} \cdot 10^4$$

$$V_c = \frac{T}{1.592 \cdot \Delta p \cdot \eta_m} \cdot 10^4$$

$$T = 1.592 \cdot V_c \cdot \Delta p \cdot \eta_m \cdot 10^{-4}$$

$$N = \frac{Q \cdot \Delta p}{6 \cdot 10^4} \cdot \eta_t$$

1.14.1 Parameter relationships

Example

APM212/11 $V_c = 11.1$ cm³/r $Q_{IN} = 18.5$ l/min $\Delta p = 200$ bar $\eta_v = 90\%$ $\eta_m = 90\%$

$$n = \frac{10 \cdot 18.5}{11.1} \cdot 90 = 1500 \text{ r/min.}$$

$$\eta_t = 0.90 \cdot 0.90 = 0.81 = 81\%$$

$$N = \frac{18.5 \cdot 200 \cdot 81}{6 \cdot 10^4} = 5.0 \text{ kW}$$

$$T = 1.592 \cdot 11.1 \cdot 200 \cdot 90 \cdot 10^{-4} = 31.8 \text{ Nm}$$

3 APM212 customised versions (Cooling systems or other applications)

In this section, a single APM212 motor can be configured and customized .

APM212 wide availability of covers, bodies, gears and seals sets provides great flexibility to APM212 motor range and allows several different motor configurations.

In order to simplify the selection of the desired motor combination, a 'configurator form' is available and, by filling it out, it will guide you in the motor creation process.

3.1 Customised versions order example

A	P	M	R	2	1	2	/	8	,	5	L	N	-	S	-	A	6	S	-	1	C	H	-	G	H	1	-	*	*	*

Function
APM= single gear motor - unidirectional
APMR = single gear motor - reversible

Series
212

Displacement
8.5= 8.4 cm³/rev
11= 11.1 cm³/rev
15= 15.1 cm³/rev
19= 19.2 cm³/rev
22= 22.2 cm³/rev
26= 26.2 cm³/rev

Version
Omitted if 12 teeth standard
LN= 12 teeth Low Noise version

Rotation
S = left-hand rotation
D = Right-hand rotation
Omitted if reversible version

Shaft end code
see section 3.3

Shaft seal material type code
see section 3.4.1

Front cover series/material with/without bearing code
see section 3.4.2

Type of ports code
see section 3.5

Inlet/outlet port size code combination
see section 3.5

Body material + seal material code
see section 3.5.1

Back cover type
see section 3.6

BHRE section :
Version - Progressive number (omitted)

3.2 Single motor dimensions

motor size	A		C*	
	mm	inches	mm	inches

UC16 = Antishock-anticavitation valve ordering code

(see section 3.7.5)

G Cast iron back cover

4 = Drain line port type

Drain line port:

Thread	Tightening torque	Ordering code
1/4" BSP	30_{-6}^{+7} Nm	1 (on request)
M12x1.5	30_{-6}^{+7} Nm	3 (on request)
SAE6	30_{-6}^{+7} Nm	4 (standard)

A = Drain line port position

Anticavitation valve integrated inside the front cover
is requested, please specify +CF

IMPORTANT! This circuit must be combined with front cover in cast iron, anticavitation valves included (see section 3.7.4)

3.7.10 Cast iron back cover with integrated valves: Proportional relief valve with ON-OFF reversible valve ($Q_{\max} = 60 \text{ l/min}$)

IMPORTANT!

The inverse proportional pressure relief cartridge valve has to be completely open before to switch the Directional Control valve.

A	P	M	R	2	1	2	/	8	,	5	-	-	A	6	S	-	1	C	H	-	C	2	3	A	3	R	+	C	F
---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---

C = Type of cast iron back cover/valve

Back cover with "AL" cavity and proportional pressure-relief cartridge valve type $Q_{\max} = 60 \text{ l/min}$

Inverse proportional pressure-relief cartridge, size 5, DBVSA-1LG (NBR seals)

23 = Pressure settings

Pressure range : 10 = 100 bar
16 = 160 bar
23 = 230 bar

For further settings value available please consult Bucher Hydraulics.

$p = f(I)$ Pressure adjustment characteristic ($Q = 5 \text{ l/min}$)

For further characteristics see catalogue: 400-P-586101-E

ATTENTION!

To prevent any pressure surges, outlet port must be routed to tank with the least possible back-pressure. Any tank pressure acting at outlet port is additive to the pressure setting at the main inlet port.

IMPORTANT!

Further note available in the dedicated catalogue 400-P-586101-E

$p = f(I)$ Pressure adjustment characteristic ($Q = 5 \text{ l/min}$)

A = Solenoid connection type and nominal voltage

DT
A = 12 V DC
B = 24 V DC

AJ
C = 12 V DC
D = 24 V DC

IMPORTANT!

To achieve the proportional pressure-relief cartridge's maximum performance rating, fit the solenoid coil with the plug pins at the top. When fitting the cartridges, note the mounting attitude (preferably vertical, with coil down automatic air bleed) and use the specified tightening torque. No adjustments are necessary, since the cartridges are set in the factory.

3 = Port type

	Thread	Tightening torque	Ordering code	
1/2" BSP	P= 3/4"-16 UNF (SAE8)	60_{+5}^0 Nm	3 (SAE)	4 (BSP)
1/2" BSP	T= 3/4"-16 UNF (SAE8)	60_{+5}^0 Nm		
1/4" BSP	D= 9/16"-18-2B UNF (SAE6)	30_{+5}^0 Nm		

Directional control valve
33 Watt
Connector type:
DT04-2P ED
100%

Anticavitation valve integrated inside the front cover is requested, please specify +CF

IMPORTANT! This circuit must be combined with front cover in cast iron, anticavitation valves included (see section 3.7.4)

4 Accessories

4.1 Electronic module, ESLF series

- Up to 3 temperature sensor can be used
- PTC and NTC sensor can both be used

- Same electronic system for reversible and non-reversible motors
- Can be supplied with or without housing

Control system features	
Power supply	12 V - 30 V DC
Reference voltage	8 V DC max. 20 mA
Temperature inputs	3 (T1, T2, T3)
Temperature sensor processing (U sensor)	Either PTC or NTC per card, using two-wire method
Temperature control range	0°C - 100°C
Setting type of sensor; adjustment	Diagnostics input online; calibration potentiometer for each sensor
Prop. solenoid output for fan motor -max. fan motor speed -min. fan motor speed	max. Output current $I_{\max} = 2,1 \text{ A}$ minimum current $I_{\max} = 0,2 \text{ A}$ maximum current (adjustable) $I_{\max} = 2,1 - 1,4 \text{ A}$ via potentiometer
ON/OFF solenoid output	Max. output current 2.5 A
Diagnostics	LED for each solenoid output LEDs for control mode
Electrical connection	DIN 41612 Type D edge connector, or screw terminals
Type of protection	non-encapsulated and encapsulated models
Dimensions	100 mm x 100 mm x 25 mm (W x H x D)
Temperature range	-20°C to +50°C

ESLF 101 - 8 1 * * *

Electronic fan drive controller, series ESLF

Encapsulated = 8

Non-encapsulated = 9

Screw terminals = 1

Edge connector = 0

Suitable for 12 V and 24 V DC

IMPORTANT! For detailed informations, see www.bucherhydraulics.com

4.2 External manifold for reversing control, STB series

$P_{max} = 250 \text{ bar}$
 $Q_{max} = 50 \text{ l/min}$

STB LRU - 01 - P 16 M 06 09 1 2 V D C - -

System manifold series STB

With reversal of fan rotation, LRU

Design no.: 01

Pressure control valves:

P = Proportional, model DBVSA-1CG-...-10

H = manual adjustment, model DVPA-1-10...

W = electric model W UVPZ-1-10...

Pressure setting: 10 = 100 bar 16 = 160 bar 23 = 230 bar

Port thread: P / A / B = M18x1,5 3/8" 3/4-16UNF
T = M22x1,5 1/2" 7/8-14UNF

Nominal size 06 = 6 mm

Minimum flow for reversal switching 09 = 9 l/min

Voltage and current plainly specified: 12 V DC

24 V DC For others, contact Bucher Hydraulics

Solenoid coil connectors: Blank = with DIN 43650 / ISO 4400 (standard) J = Junior-Timer radial
M100 = without DIN Mating plug F = free cable ends / flying leads (length: 500 mm)
C = Kostal M27x1 I = Junior-Timer axial
D = Deutsch DT-2

T = with quenching diode P6KE33CA

IMPORTANT! For detailed informations, see www.bucherhydraulics.com

S T B L R U - 0 1 - P 1 6 M 1 0 3 0 1 2 V D C - -

System manifold series STB

With reversal of fan rotation, LRU

Design no.: 01

Pressure control valves:

P = Proportional, model DBVSA-1CG-....-10

H = manual adjustment, model DVPA-1-10....

Pressure setting: 10 = 100 bar 16 = 160 bar 23 = 230 bar

Port thread: P / A / B = M26x1,5 3/4" 1 1/16-12UNF
T = M26x1,5 3/4" 1 1/16-12UNF

Nominal size 10 = 10 mm

Minimum flow for reversal switching 30 = 30 l/min

Voltage and current plainly specified: 12 V DC

24 V DC For others, contact Bucher Hydraulics

Solenoid coil connectors: Blank = with DIN 43650 / ISO 4400 (standard) J = with plug connectore Junior-Timer radial
M100 = without DIN Mating plug F = free cable ends / flying leads (length: 500 mm)
C = with plug connector Kostal

Quenching diode (specify if requested)

 **IMPORTANT!** For detailed informations, see www.bucherhydraulics.com

5 Product identification plate
